

Melon Head

Here's a simple experiment for all those unbelievers out there to try. Take two melons. Strap one into a cranial, leave the other unprotected. Suspend them 12 feet above the pavement and then let them go.

It'll happen every time. One will get it's brains (sorry...seeds) splattered all over the concrete. The other will remain whole--a little shaken, but whole nonetheless.

The lesson found in this little physics experiment is simple. *"Wear your head protection. It could save your melon."*

P.S. Someone always writes to tell me somethin' like "But I don't work on planes." C'mon...think outside the box here. Substitute the cranial with a bicycle or motorcycle helmet. Don't ride? Use a hard-hat, cover one of the melons, leave the other exposed and drop a brick on both. Betcha get the same results.
